End-to-End QA Testing Prompt

Claude Code prompt using the **webapp-testing** skill (Playwright, Python)

Setup

Use the "webapp-testing" skill from https://github.com/anthropics/skills (skills/webapp-testing). Install it first if it's not already available:

```
/plugin marketplace add anthropics/skills
```

Read its SKILL.md before starting.

Goal

Test every feature of my application end-to-end and report what works and what is broken.

Strict rule

DO NOT MODIFY ANY APPLICATION CODE.
• Do not edit, refactor, or "fix" any file in the project (frontend, backend, config, DB schema, package files).
• You may only create NEW files inside a separate folder: `./qa-tests/` (test scripts, screenshots, logs, report).
• If you find a bug, document it — do not fix it.

App details

Project folder	[path/to/project]
Backend start command	[e.g. uvicorn main:app --port 8000]
Frontend start command	[e.g. npm run dev -- --port 5173]
App URL	[http://localhost:5173]
Test login (if needed)	[test user / test password — or create a test account via the sign-up page]

Steps

1. Explore the codebase (read-only) and list every feature/page/route/API endpoint you find. Show me this feature list before testing.

2. Start the servers using the skill's `scripts/with_server.py` helper.

3. For each feature, write a Playwright (Python) script in `./qa-tests/` that:

- opens the page, waits for networkidle, takes a screenshot
- tests the happy path (valid input → expected result)
- tests edge cases (empty fields, invalid input, wrong password, duplicate entries, very long text)
- checks browser console errors and failed network requests

4. Also test: navigation/links, form validation messages, login → logout flow, protected pages without login, and mobile viewport (375px width).

5. Run all tests. If a test script itself has a mistake, fix the TEST script only — never the app.

Output

Create `./qa-tests/TEST_REPORT.md` with:

- Summary table: Feature | Test case | Status (PASS / FAIL) | Notes
- For every FAIL: steps to reproduce, expected vs actual, screenshot path, console/network error, and the likely file/line causing it (do not fix)
- Overall: X passed / Y failed
